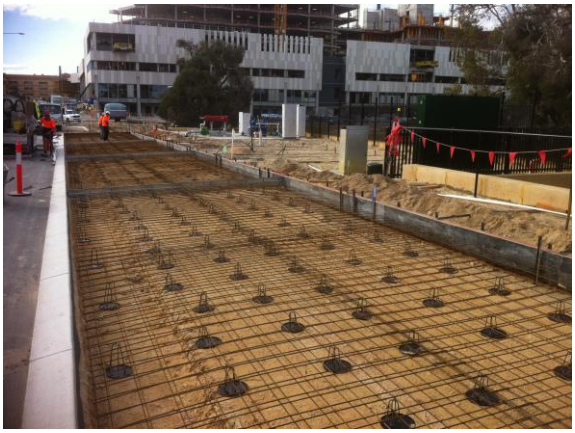
Fiona Stanley Hospital

August 2010 – ongoing
Client: Brookfield Multiplex
Contract value $2,120,000



This work is being carried out on the largest infrastructure project in Perth. Our scope of works encompasses footpaths to the entire site in various materials from broom finish grey concrete through washed aggregate concrete to concrete base slabs with direct adhered natural stone. Other elements being undertaken are formed and poured concrete stairs, footings for various artworks and granite paving on versi-jacks as well as concrete paving on the building roofs. This project required large quantities of concrete to be poured in short periods of time demonstrating The MG Group's ability to accomplish large poring of concrete to achieve targets over vast distances.

The nature, size and depth of this site required that strict procedures and protocols were adhered to. Robust planning and coordination to 'slot' into the scheme of works causing minimal disruption to concurrent or following trades is vital. Health and Safety is rigorously monitored. The movement of traffic on site requires adequate planning so as not to bring the traffic flow on site to a halt working in close proximity to traffic. Many potential delays have to be foreseen and combating such delays (inclement weather) and deviation from the planned program of works are dealt with efficient logistical planning enabling targeted staged handovers.
